

Serial No. 09/702,963

**IN THE SPECIFICATION**

Please replace the Abstract of the Disclosure as follows:

This invention relates to an apparatus and an associated method that tests the response of a computer component ~~to inputs~~. The apparatus includes a modeler, a tester, and a test generator. The modeler provides a model of the computer component object behavior. The tester provides stimulus values to be applied to the computer component object. The test generator converts the model of the computer component object behavior and the stimulus values into test script. The test script can be executed by an automated test executor.
